Assignment 2: Coding Basics

David Robinson

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on coding basics.

Directions

- 1. Rename this file <FirstLast>_A02_CodingBasics.Rmd (replacing <FirstLast> with your first and last name).
- 2. Change "Student Name" on line 3 (above) with your name.
- 3. Work through the steps, **creating code and output** that fulfill each instruction.
- 4. Be sure to **answer the questions** in this assignment document.
- 5. When you have completed the assignment, **Knit** the text and code into a single PDF file.
- 6. After Knitting, submit the completed exercise (PDF file) to Sakai.

Basics, Part 1

- 1. Generate a sequence of numbers from one to 30, increasing by threes. Assign this sequence a name.
- 2. Compute the mean and median of this sequence.
- 3. Ask R to determine whether the mean is greater than the median.
- 4. Insert comments in your code to describe what you are doing.

```
#1.
#Note that this sequence stops at 28 instead of 30 because adding 3 to 28 would result in 31.
seq(1,30,3)
```

[1] 1 4 7 10 13 16 19 22 25 28

```
#2.
sequence_1To30 <- seq(1,30,3)
mean_sequence1To30 <- mean(sequence_1To30)
median_sequence1To30 <- median(sequence_1To30)

#3.
#Asking R to determine whether the mean is greater than the median via Boolean logic.
mean_sequence1To30>median_sequence1To30
```

[1] FALSE

Basics, Part 2

3 Michelangelo

Donatello

4

- 5. Create a series of vectors, each with four components, consisting of (a) names of students, (b) test scores out of a total 100 points, and (c) whether or not they have passed the test (TRUE or FALSE) with a passing grade of 50.
- 6. Label each vector with a comment on what type of vector it is.
- 7. Combine each of the vectors into a data frame. Assign the data frame an informative name.
- 8. Label the columns of your data frame with informative titles.

```
#5 and #6
#This vector is a list of string (character) values.
StudentNames <- c("Leonardo", "Raphael", "Michelangelo", "Donatello")</pre>
#This vector is a list of integer values.
TestScores \leftarrow c(100, 75, 50, 25)
#This vector is a list of Boolean (logical) values.
TestScoresPassing <- c(TRUE, TRUE, TRUE, FALSE)</pre>
#7 and #8
df_StudentNamesAndTestScores <- data.frame(StudentNames,TestScores,TestScoresPassing)
{\tt df\_StudentNamesAndTestScores}
##
     StudentNames TestScores TestScoresPassing
## 1
         Leonardo
                          100
## 2
                           75
                                             TRUE
          Raphael
```

TRUE

FALSE

9. QUESTION: How is this data frame different from a matrix?

50

25

Answer: #9 Matrices can only contain a single class of data, while data frames can consist of many different classes of data (Source: https://carpentries-incubator.github.io/lc-litsearchr/07-data-frames-matrices-and-lists/index.html $\#:\sim:$ text=The%20main%20difference%20is%20that,grid%20of%20rows%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20and%20a

10. Create a function with an if/else statement. Your function should take a **vector** of test scores and print (not return) whether a given test score is a passing grade of 50 or above (TRUE or FALSE). You will need to choose either the **if** and **else** statements or the **ifelse** statement.

11. Apply your function to the vector with test scores that you created in number 5.

#11
evaluateScoresFrom5 <- evaluateScores(TestScores)</pre>

[1] TRUE TRUE FALSE FALSE

evaluateScoresFrom5

[1] TRUE TRUE FALSE FALSE

#For reviewer / TA -- note that the code below is just reference for Question #12. # 'evaluateScores2(TestScores)

12. QUESTION: Which option of if and else vs. ifelse worked? Why?

Answer: The option 'ifelse' worked. Per demonstration code above for function 'evaluateScores2', the following code is produced: 'Error in if (y > 50) TRUE else FALSE: the condition has length > 1'. It appears that 'if' and 'else' cannot handle vectors as they have length > 1 object.
